

Taxa Introduced in the Basteria.

With this list we like to give you some insight regarding all taxa up to genera level introduced as new in the Basteria. This list will provide all information regarding the original publication of the species. This will include the page numbers, figures, plates, type location and its current taxonomic location in families. To compile this list we used the list of sovereign states for locations and correct spelling of country names. We used WoRMS for marine species, and a preliminary list of family and genera taxa for terrestrial molluscs in order to determine the current family location of the genera in which species are described. In this list we have also added all nomen novum species. For (sub)genera and nomen novum descriptions fields of country and locality are left empty. Version 2.1 includes all taxa up to volume 82(1-3).
